

Reflection:

While working on this lab, I worked with binary search trees (BSTs) and practiced working with existing code modules. Additionally, I learned how to organize employee positions as data within a hierarchical structure.

Extensions:

I reimplemented all of the features provided by the previous implementations, all except for the `removeSupervise` function.

Grading:

At the beginning I felt that this project was pretty challenging, but eventually, I managed to figure out all the necessary abstractions and implementation details. I successfully added a functioning driver, accomplished all three extra functionality tasks, and ensured my code operates as an abstract tree. I also provided comprehensive javadocs explaining the functions. My code contains well-formatted comment blocks with proper indentation, and I have incorporated nearly all of the suggested extensions. Therefore, I feel that I should receive full credit for all the aspects of this lab.
